

Z_InverseTransformover translucent background

```
plot(data, char, size, clr):= for k∈1..rows(data)
    [ r3_k:=char r4_k:=size r5_k:=clr ]
    augment(data, r3, r4, r5)
```

appVersion(3) = "0.98.6179"

```
n:=1..16      r:=2      c(x):={ 1 if (1≤x)^(x≤16)
                                "" otherwise
```

```
α:=0.5 Experiment [0.125, 0.25, 0.5, 0.625, 0.75]
```

```
H(z):= (z+α) / (z^2 - z + α)      Y(z):= ( (z+α) / (z^2 - z + α) ) * ( z / (z-1) )
H(z) impulse perturbation
Y(z) algo input to ... Inv(n, Y)
```

```
H(0)=1      ch(x):={ 1 if (0≤x)^(x≤16)
                    "" otherwise
```

The inverse Z_transform in the discrete domain

$$\text{Inv}(n, Y) := \frac{r^n}{2 \cdot \pi} \cdot \int_0^{2 \cdot \pi} Y(r \cdot \exp(i \cdot \theta)) \cdot \exp(n \cdot \theta \cdot i) d \theta$$

```
for j∈1..rows(n)
    y_j := Inv(n_j, Y)
```

```
{ R:= augment(n, |y|)
  Z:= plot(R, ".", 14, "red")
```

1/1 sanity Mathcad source code

```
{ H(x) · ch(x)
  Z
```

Z_system for inverse transform

```
{ H(x)
  Y(x) · c(x)
```

If you want some regions white over the translucent, click in those regions, set background [254,254,254]

R =

| | |
|----|-------|
| 1 | 1 |
| 2 | 2.5 |
| 3 | 3.5 |
| 4 | 3.75 |
| 5 | 3.5 |
| 6 | 3.125 |
| 7 | 2.875 |
| 8 | 2.813 |
| 9 | 2.875 |
| 10 | 2.969 |

| 15 | 2.992 |
| 16 | 2.988 |

1. Insert Image empty argument
2. size for convenience
3. switch border ON/OFF
4. capture a region, crop image
5. save as *PNG
6. Insert Background
7. Browse from file
8. double click ... done
-
9. additionally to native PNG transparency: you can add/remove luminosity ... How ?
10. copy the captured_cropped image ... paste in IrfanView.
- At this point in Irfanview
11. increase/decrease Gamma.
12. save that new version *.PNG

You can slide whatever you want in a dead image region. Not like Formated Label or Translucent . To acces the inserted stuff, you must slide the image region. Very convenient for abstract. Ideal for creating a cartouche.

IrfanView is of exceptional quality zoom/rotate images.

1. To access X_Y: slide up gray area Alternately: delete some dots to access X_Y from the RHS click.
2. Click-in gray, background at will

Show/hide input data

Cu resistivity in high induction magnetic field

"unfamiliar Copper Resistivity"

$$\left[\begin{array}{lll} a:=1.454 \cdot 10^{-17} & b:=4.437 & c:=5.786 \cdot 10^{-7} \\ d:=3.292 & f:=7.649 & g:=5.671 \cdot 10^{-10} \end{array} \right]$$

$$\text{Cu}(T):=g + \frac{a \cdot T^b}{1 + c \cdot T^d \cdot \exp\left(-50 \cdot f \cdot \left(\frac{1}{T}\right)^f\right)}$$

brush over
4background

Create cartouche:

1. Insert image <= menu
2. OFF display input data
3. Click-in2size by handles
4. Brush over4user background
5. Add/slide items to compose
6. White [254,254,254]
7. Black [1,1,1]
