

Using include in a function.

```
appVersion(4) = "0.99.7610.506"
```

```
g(x) := | include("ref_f.sm")           File ref_f.sm -->
        | b := 3
        | f(x)
```

```
g(1) = ■      lastError = "File not found: ref_f.sm"
```

What I expect: $g(1)=5$ and both $f(x)$ and a locals in $g(x)$

```
| include("ref_f.sm") = 5      f(x) = 3 + 2 · x      a = 2
| b := 3
| f(1)
```
